

Leading VoIP Networking Technology

Using Voice over IP (VoIP), Provider 680 leverages the latest technology to provide a cost-effective and scalable nurse call solution for facilities of any size. Residing on its own Ethernet nurse call network, the Provider 680 Nurse Call System is unaffected by any issues with the facility's network and is available 24/7 for any potential emergency.

The flexibility of the Provider Nurse Call Network supports caregivers delivering high quality care while protecting the safety of residents and patients. The stations in patient and resident areas, along with stations in staff areas, seamlessly connect to Nurse Consoles at nursing stations providing a complete life safety alerting and communications network. From a single nursing unit to multiple buildings on a campus, patient/resident calls route anywhere across the Provider Nurse Call network while the system's digital audio means answering a call from several buildings away is as crystal clear as answering a call down the hall.

Managing Census and Day/Night Staffing Levels

The networked Provider 680 lets facilities manage patient/resident call routing to balance workloads and staffing levels depending on census and staffing at night. The Room Swing option lets rooms or areas "swing" between nursing units to balance patient/resident call loads. The Day/Night Transfer feature allows for calls at night to reroute to a nursing station or front desk that is staffed at non-peak hours. Room Swing and Day/Night Transfer streamline alerting and communications for timely responses.

Provider[®] 680 Nurse Call System

Networked Nurse Call for the Most Popular Step-Saving Options

Linking all nursing areas together as a unified Provider 680 Nurse Call Network supports a single point of integration for the most popular and step-saving options including:

Wireless SIP Phone Integration: routes patient/resident calls directly to their caregiver's mobile phone; caregivers remain mobile and able to respond to calls

Text Messages: a cost effective facility-wide option to route text alerts of calls to the caregiver's pocket pager and to route emergency events to caregiver teams

PC Console: a real-time active call display available on any networked computer within the facility, allowing staff and managers to monitor nurse call activity in their area or across the entire facility

Automated Overhead Paging: interfaced to the public address system, high priority patient/resident calls announce over paging speakers to alert caregivers to the events

Real-Time Locating: integrated with the most popular staff locating systems; caregivers automatically register into rooms so staff can easily find each other without disruptive overhead paging

Cross Platform Integration: by sharing the same nurse call network, both Provider 680 and Provider 790 work together as a unified solution

 Provider[®] 790
Nurse Call System

A Complete Life-Safety Solution

The VoIP Provider Nurse Call Network's flexible call routing and integration options support staff efficiency and a quick response for the safety and satisfaction of residents and patients. Immediate and multiple modes of alerting staff to active calls means no calls are missed and the closest caregivers can respond. The Provider Nurse Call Network integration options can be easily added in the future allowing facilities to choose the options that best fit their workflows and their budget.
