

Streamlined Notification to Speed Response

Multiple modes of annunciation alert caregivers to critical events

When seconds count... Provider 790 gives you the tools to respond quickly

Speed response with:

- Centralized notification
- Automated overhead pages
- Wireless crash team alerts

Code blue alarms must mobilize a team of caregivers and direct them to the patient in cardiac arrest as quickly as possible. Traditional methods of calling the operator to overhead page the crash team can waste precious moments. With the Provider 790 system you have multiple facility-wide code blue alerting options to quickly notify the crash team:

Centralized Notification

For instant code call notification at your facility's switchboard or centralized dispatch area, a code call from anywhere across the entire Provider 790 nurse call network annunciates at one or more central locations via large flat panel displays or nurse consoles. The nurse console code call tones immediately direct attention to the active code call while the large display includes the room number and descriptive location. From the nurse console, the code calls can be answered and confirmed, if desired.

Integrated code timer shows exactly how long the call has been active

Any code button in the same room can initiate the code timer

Automatic Code Announcements

Precious seconds are saved when the public address announcement for code calls is automated. Provider 790 integrates with your facility's public address system for instant code call announcements including the room number, nursing unit name, location within facility, and instructions. Provider 790's multiple zone outputs give you the flexibility to determine what areas should receive the announcement, while the "call canceled" announcement lets mobile caregivers know that an accidental call has been cleared.

Wireless crash team notification

Critical information can be missed if your facility only relies on public address announcements for emergency events. Complementing announcements with messages to a caregiver's smart phone, SIP wireless phone, or pocket pager means everyone on the crash team gets the same information at the same time. A single code blue button press from anywhere in the facility immediately alerts the crash team with the room number and bed over their wireless devices. Provider 790's unique SIP Group Alert technology often eliminates the need for expensive middleware to alert multiple smart or SIP phones simultaneously to an emergency event.

The multiple Provider 790 code blue alerting options are also available for any type of patient or staff call. Create local and facility-wide crash teams for different types of events including "Staff Emergency" and "Bed Exit" alerts. Using these alerting options, caregivers are immediately notified of any type of critical event so they can respond as quickly as possible.
