

Supporting a Caregiver's Passion for Patient Care

Staff working as a team for patient calls, pain assessment, wound care, and patient rounds

The Provider 790 nurse call systems gives patients 'peace of mind' because they know their caregivers will visit them regularly and respond quickly to their calls. Provider 790 supports a comprehensive team approach to patient care with automatic team-based alerts that speed responses to patients while keeping caregivers mobile and in more direct contact with their patients.

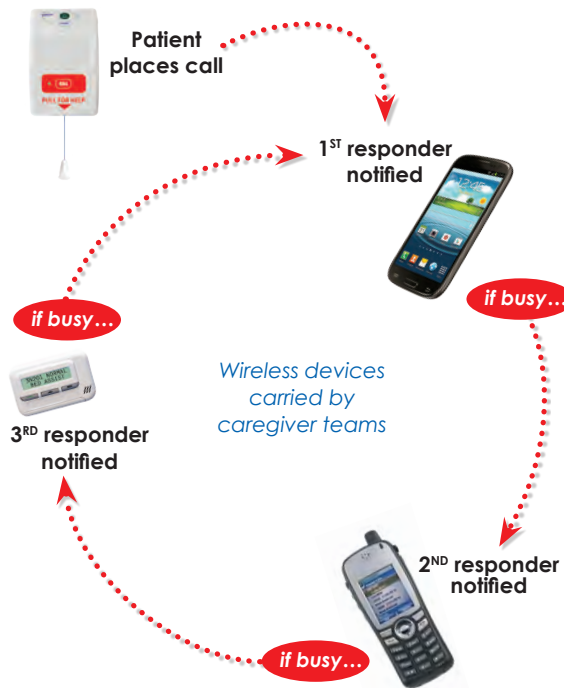

Staff presence lets caregivers find team members quickly by viewing the dome lights in the corridor

Staff Teams for a Timely Response to Patients

With the Provider 790 system, staff are assigned to their patients in teams and notified of patient calls over their wireless smart phone, SIP phone, or pocket pager. When a patient places a call and their primary caregiver is occupied, the Provider 790 system automatically alerts backup caregivers. As part of this team, caregivers also receive specific call priorities and tasks matching their responsibilities. The wireless alerting and communication options with Provider 790 are in addition to the standard call notification through dome light, duty stations, and nurse console. With these multiple modes of notification and automatic rerouting, no patient call goes unanswered.

Automated staff presence saves steps. Simply entering a room automatically clears patient calls and service requests.

Supporting team-based nursing with:

- Wireless event notification
- Integrated patient rounding
- Rerouting events and alerts to available caregivers
- Everywhere access with touchscreen staff terminals and networked activity displays
- Automated public address announcements for emergency events

Patient Rounds, Wound Care and Pain Assessment

Provider 790's rounding and reminder features automatically alert caregivers to visit and revisit their patients within a set time period. Staff have the option of a reoccurring reminder

for applications such as pain assessment and wound care or a onetime self-reminder. When a rounding period expires, first the primary and then the backup caregivers are notified of the event over their wireless device. The dome light outside the patient room and the activity display on the facility's LAN also alert caregivers to an

expired rounding or reminder. All of these display and alerting options support a timely response to patient rounding.

If the patient is uncomfortable before the pain assessment period expires, they can notify their caregiver directly by using the "PAIN" call button.

Your Comprehensive Team Nursing Solution

With Provider 790, your facility's caregiver teams are continuously connected to their patients and each other. The rounding and alerting functions route within the team for the fastest response to patient needs, while wireless alerting options minimize disruptive overhead pages. Patient requests and streamlined staff team interaction is just a button press away.
